EXAMINER'S AMENDMENT

An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

The application has been amended as follows.

The claims are amended as follows.

12. (canceled)

14. (currently amended) An isolated or purified truncated pullulanase produced by a method comprising the steps of:

a) obtaining a recombinant host cell comprising a nucleic acid encoding a truncated variant of the mature form of the *Bacillus deramificans* pullulanase of SEQ ID NO:2,

b) culturing said host cell under conditions suitable for the production of the truncated pullulanase, and

c) recovering the truncated pullulanase, wherein the truncated pullulanase comprises a deletion of 98 or 102 amino acids from the amino terminus of the mature form of the *Bacillus* deramificans pullulanase of SEQ ID NO:2 and is capable of catalyzing the hydrolysis of an alpha-1,6-glucosidic bond.

variant of the mature form of the Bacillus deramificans pullulanase of SEQ ID NO:2, wherein said truncated pullulanase is capable of catalyzing the hydrolysis of an alpha-1,6-glucosidic bond, and wherein said truncated pullulanase comprises a deletion of 98 or 102 amino acids from the N-terminus of the mature pullulanase.

70. (canceled)

Authorization for this Examiner's Amendment was given by telephone by Applicants' agent, Ms. Jill Jacobson, on July 22, 2008.

2. The following is an examiner's statement of reasons for allowance. As previously discussed, Deweer et al. (US 5,721,128) et al. disclose the pullulanase of SEQ ID NO:2 in its mature (truncated) and precursor (full-length) forms (SEQ ID NOS: 10 and 11 are the polynucleotide encoding the precursor form and the mature polypeptide, respectively). Deweer et al. also disclose the heat and acid stability of the truncated (mature) form of the enzyme and the *Bacillus licheniformis* strain that makes the enzyme (see col. 1, line 43, to col. 2, line 25; and col. 5, lines 20-28). Deweer et al. disclose liquid or solid compositions for digesting starch comprising their SEQ ID NO:11 and a second enzyme, e.g., an amylase or glucosidase, or a glucoamylase from *Aspergillus* and that a two-enzyme composition may contain at least 60%, i.e., 60 to 99% of the truncated (mature) pullulanase (see col. 3, line 57, to col. 4, line 15; and col. 8).

McPherson et al. disclose that pullulanases are very large enzymes compared to other polysaccharide hydrolases and that this large size creates steric hindrance which reduces the efficiency with which they can cleave internal alpha-1,6 bonds in highly branched substrates (see p. 723, left col.). McPherson et al. disclose that pullulanases in a wide variety of bacteria and fungi do not share a high degree of overall amino acid sequence identity. But, they do share conserved sequences in their C-terminal halves, where the enzymatic activity resides, the

N-terminal region is not required for enzymatic activity, and experiments with pullulanases from a variety of microorganisms are underway to determine how much of the N-terminus may be deleted with the retention of activity. One example is provided in which the deletion of 170 amino acids, which is about 200 amino acids, from the N-terminus lead to a 30% increase in activity relative to the native enzyme (see p. 723, right col.). Thus, McPherson et al. disclose deleting portions of the protein from the N-terminus to improve enzymatic activity.

Page 4

Albertson et al. disclose that the four highly conserved regions of pullulanases are in the central and C-terminal portions, while the N-terminal portions vary in length and are not required for function. Albertson et al. also disclose a pullulanase truncation fragment having an N-terminal deletion of 127 amino acids, which is about 100 amino acids (see abstract). A polynucleotide referred to as NZ1452 encodes a pullulanase having an N-terminal 95-amino acid deletion relative to the wild type (which is about 100 amino acids) with the retention of function (see p. 38). Thus, Albertson et al. also disclose deleting portions of the protein from the N-terminus, which makes the proteins easier to work with and does affect enzymatic activity.

But, the prior art does not disclose the truncated forms of the mature form of the pullulanase of SEQ ID NO:2 that are recited in the claims, deletions of 98, 100, 102, 200 and 300 amino acids from the N-terminus.

3. Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Rosanne Kosson whose telephone number is 571-272-2923. The examiner can normally be reached on Monday-Friday, 8:30-6:00, alternate Mondays off.
